

PHASE 2 - CORE PRODUCT REVIEW

September 2026 | Client review candidate

READY FOR CLIENT REVIEW

Phase 2 turns the tested technical foundation into the working FitCalgary core product: directory and pricing comparison, clubs and events, athlete profiles, leaderboards, private evidence review, moderation and notifications across the supported clients.

FLUTTER / DART VERIFIED	GO SERVICES VERIFIED	POSTGRESQL VERIFIED	WEB VERIFIED
IOS SIMULATOR	ANDROID EMULATOR	WATCH SIMULATOR	AUTH / ROLES TESTED

The central acceptance path is working in development: athlete submission -> private evidence -> judge correction or approval -> verified result -> official leaderboard placement -> notification. Physical devices, live provider credentials, final Client content and store submission remain clearly separated from local verification.

PRODUCT CHARACTER

The recognizable cream, black and coral FitCalgary editorial system is preserved. The mobile clients use adaptive layered surfaces and accessible fallbacks; the web and admin surfaces use restrained elevation, responsive layouts and clear operational states.

A working core product

DIRECTORY AND PRICING	Searchable gyms, structured membership plans, normalized monthly and first-year cost comparison, saved gyms and responsive detail views.
CLUBS AND EVENTS	Published club and event browse/detail experiences, registration links, eligibility and temporal states, plus admin content operations.
ATHLETE AND LEADERBOARDS	Profiles, official and community result separation, personal best/history, configurable disciplines/divisions, ties, eligibility and privacy-aware placement.
PRIVATE EVIDENCE WORKFLOW	Real multipart storage path with ownership checks, signed playback, correction/resubmission, judge queue, checklist decisions, comments, approval and retention behavior.
ADMIN AND MODERATION	Role-protected operations console with users, roles, content, reviews, moderation, notifications, analytics and audit visibility. Immediate role/account restrictions are enforced by the Go service.
NOTIFICATIONS AND SECURITY	In-app inbox, preferences, essential notices, idempotent announcements, encrypted device-token registration, retry/backoff and invalid-token cleanup. Secrets stay outside source control; validation and safe errors are applied at service boundaries.

Development fixtures are isolated and clearly treated as development data. The application is built against the production-shaped data model so Client-approved content can be imported without rewriting the product.

The product in use

Real project screenshots from the current verification runs. Simulator and emulator labels are intentional; they are not physical-device claims.

iOS simulator - FitCalgary onboarding and shell

Android emulator - private evidence submission

Responsive web - structured gym comparison

Responsive web - verified official board

Apple Watch simulator - compact athlete view

Admin dashboard - role-protected operations console

One service path, tested end to end

iOS / Android / Web

|

Flutter / responsive web clients

|

Go API + authorization + workers

|

Keycloak OIDC/PKCE + PostgreSQL + private storage

CHECK	RESULT	BOUNDARY
Flutter analysis + tests	PASS	20 tests; registration lifecycle, workflows and presentation states
Go tests + vet + production build	PASS	All packages with PostgreSQL-backed workflow tests
PostgreSQL initialization	PASS	Fresh database, 7 migrations, 35 public tables
Private evidence workflow	PASS	Multipart storage, signed playback, correction, approval, rank and inbox
Web typecheck + lint + production build	PASS	Responsive routes and admin/public surfaces
iOS / Android / watchOS	SIMULATOR / EMULATOR PASS	No physical-device claim
Android release AAB	PASS	Unsigned local release output; store signing remains external

Ready for review, with the next release work explicit

PHASE 2 STATUS

The core product workflows are materially complete and verified in the local development/staging environment. The code is committed to the private development repository at the acceptance candidate prepared with this package. This review is not a production deployment claim.

CLIENT / EXTERNAL INPUTS

Final gym, pricing, club, event and ranking content; production Keycloak host and SMTP; Google and Apple identity credentials; Firebase/APNs credentials; hosting, domain, storage and store accounts remain Client or service-provider dependencies. Development fixtures are not represented as final Client data.

PHYSICAL DEVICES AND PRODUCTION

iOS, Android and Apple Watch were verified in the applicable simulator/emulator environments. Physical-device verification, signed release artifacts, production configuration, store submission and public release cleanliness are Phase 3 work and are not marked complete here.

PHASE 3 NEXT

Phase 3 completes the release candidate: production credentials/configuration, approved data import, physical-device QA, signed archives/AAB, notification provider verification, performance and security review, store assets/submission preparation, deployment and handoff documentation.

PHASE 2 - READY FOR CLIENT REVIEW

The preceding pages show the working product, the tested service path and the boundaries that remain external or belong to final release preparation. Client acceptance is not assumed. Once reviewed and accepted, the project can proceed to Phase 3 release readiness.
